

Ultralight Dark Matter

**Surjeet Rajendran,
UC Berkeley**

The Dark Matter Landscape

Poor observational constraints on the mass of dark matter

The Dark Matter Landscape

Poor observational constraints on the mass of dark matter

Need not be tied to Standard Model Scales.
Problem needs to be tackled experimentally.

The Dark Matter Landscape

Poor observational constraints on the mass of dark matter

Need not be tied to Standard Model Scales.
Problem needs to be tackled experimentally.

Dark Matter is a messenger from another sector.
Could it solve outstanding puzzles of particle physics such as the strong CP/hierarchy problems and probe cosmic inflation?

Theory Motivations

Origins

Interacting bosons with mass $\ll 100$ eV??

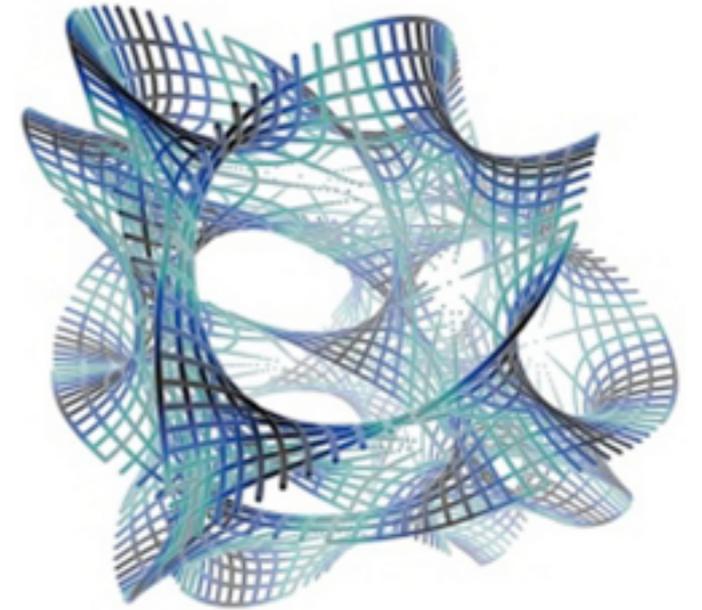

Origins

Interacting bosons with mass $\ll 100$ eV??

Goldstone bosons of broken symmetries

String theory or extra-dimensions naturally create goldstone bosons from non-trivial topology

mass, interactions $\propto 1/f_a$

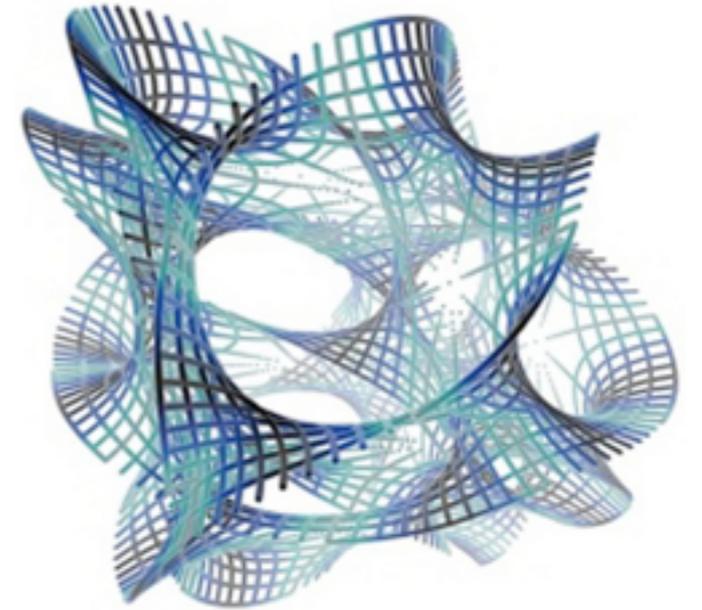

Origins

Interacting bosons with mass $\ll 100$ eV??

Goldstone bosons of broken symmetries

String theory or extra-dimensions naturally create goldstone bosons from non-trivial topology

mass, interactions $\propto 1/f_a$

Can similarly obtain U(1) gauge bosons

Stueckelberg Mechanism: gauge symmetry broken at high scale, but with weak coupling

What else can they do?

Particle Physics Applications

Naturalness: Why are some parameters fine-tuned?

Particle Physics Applications

Naturalness: Why are some parameters fine-tuned?

Consequence of symmetry?

Stringent constraints from the LHC for hierarchy problem solutions.

Does not work for cosmological constant and strong CP problems

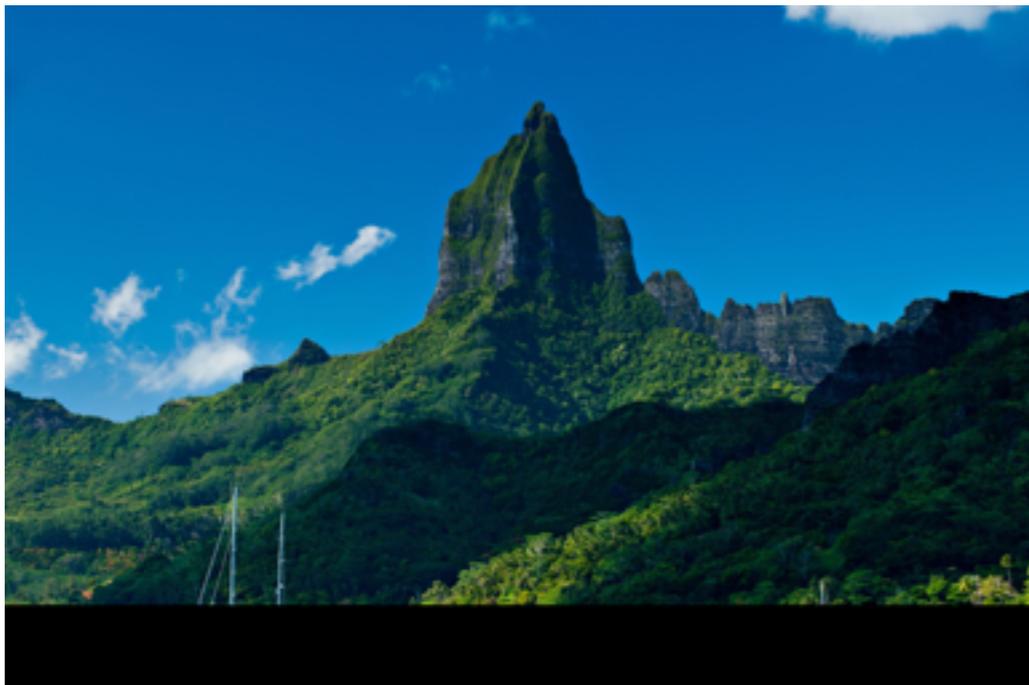

Particle Physics Applications

Naturalness: Why are some parameters fine-tuned?

Consequence of symmetry?

Stringent constraints from the LHC for hierarchy problem solutions.
Does not work for cosmological constant and strong CP problems

Time Evolution?

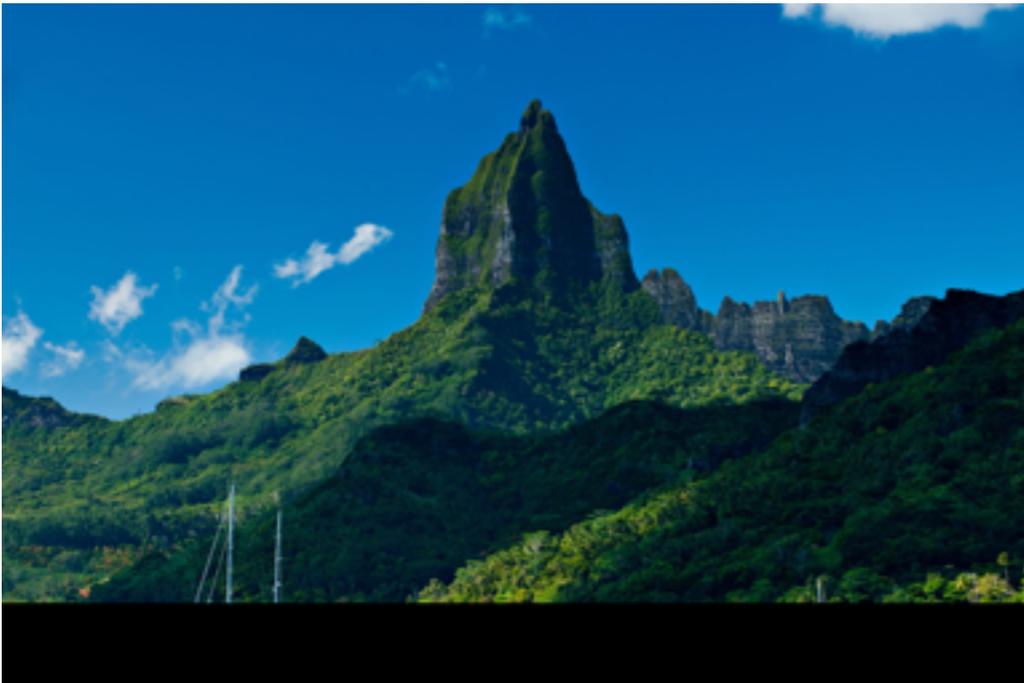

Particle Physics Applications

Naturalness: Why are some parameters fine-tuned?

Consequence of symmetry?

Stringent constraints from the LHC for hierarchy problem solutions.
Does not work for cosmological constant and strong CP problems

Time Evolution?

Slow processes (like erosion) can tune. Ultra-light particles!

QCD Axion (Strong CP)/Relaxion (Hierarchy). Bosons in mass range
 10^{-22} eV - meV

Phenomenology

Ultra-light Bosons + inflationary cosmology

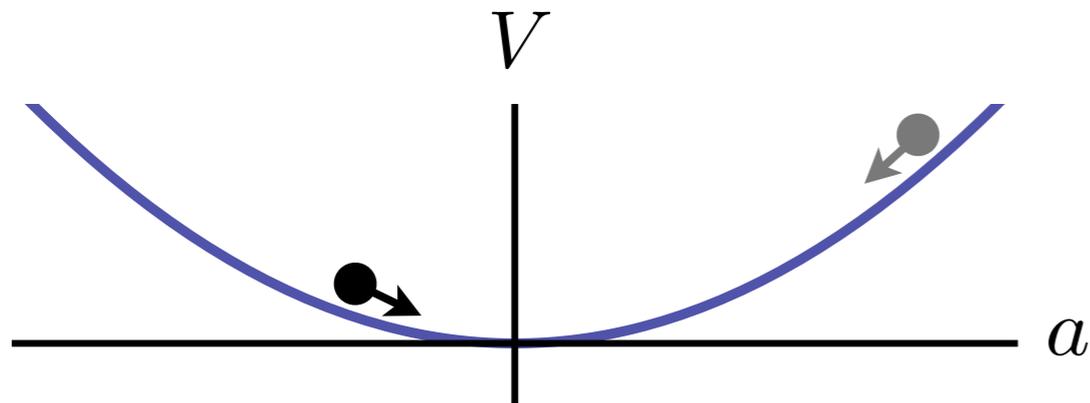

Phenomenology

Ultra-light Bosons + inflationary cosmology

Misalignment Production

Field has non-zero initial value before inflation

$$a(t) \sim a_0 \cos(m_a t)$$

cosmic expansion reduces amplitude a_0

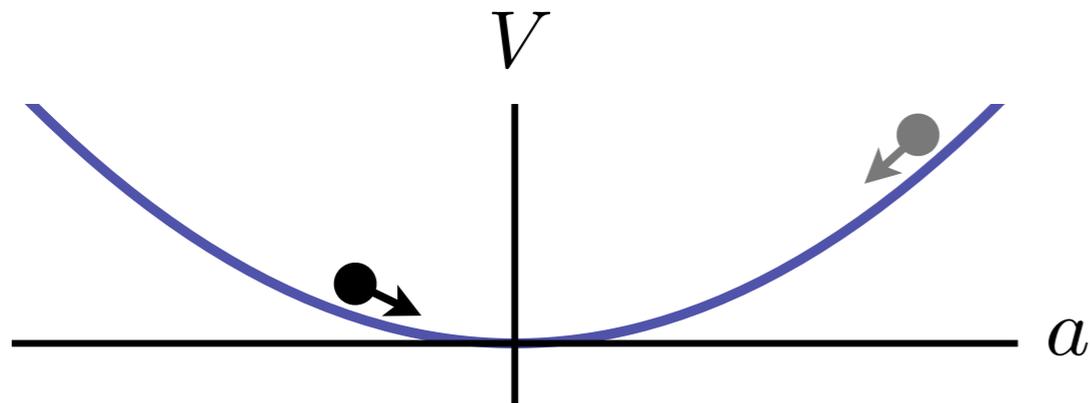

Phenomenology

Ultra-light Bosons + inflationary cosmology

Misalignment Production

Field has non-zero initial value before inflation

$$a(t) \sim a_0 \cos(m_a t)$$

cosmic expansion reduces amplitude a_0

Cold Dark Matter!

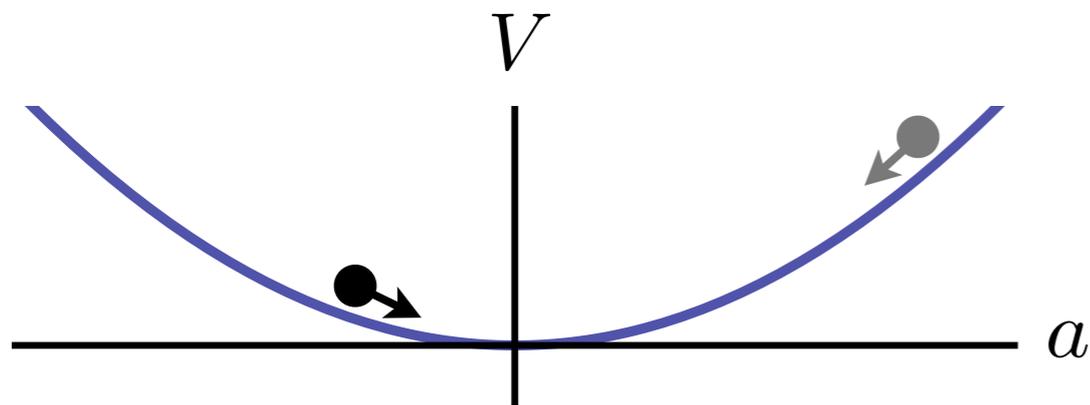

Phenomenology

Ultra-light Bosons + inflationary cosmology

Misalignment Production

Field has non-zero initial value before inflation

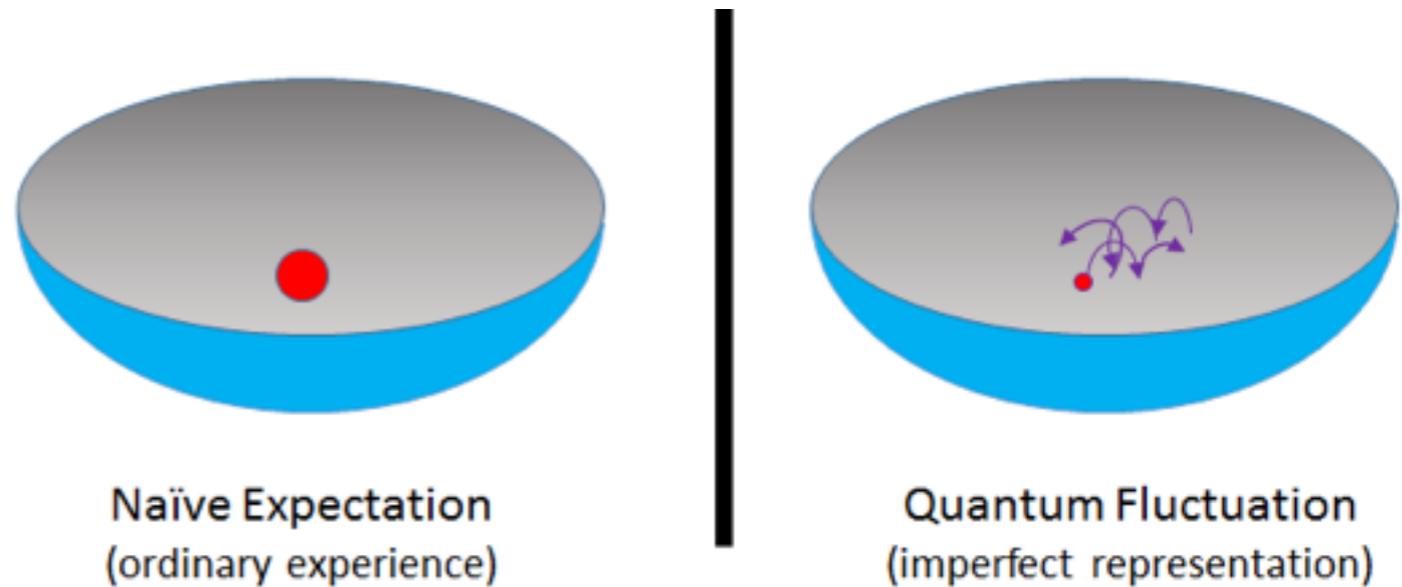

$$a(t) \sim a_0 \cos(m_a t)$$

cosmic expansion reduces amplitude a_0

Cold Dark Matter!

Quantum Production

Super-horizon modes of massive vectors redshift differently from scalars/tensors

Right power spectrum at long wavelengths

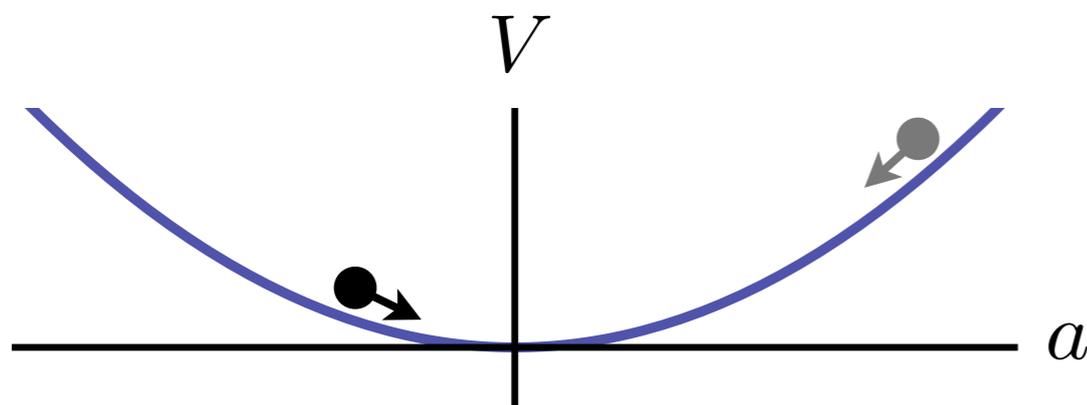

Phenomenology

Ultra-light Bosons + inflationary cosmology

Misalignment Production

Field has non-zero initial value before inflation

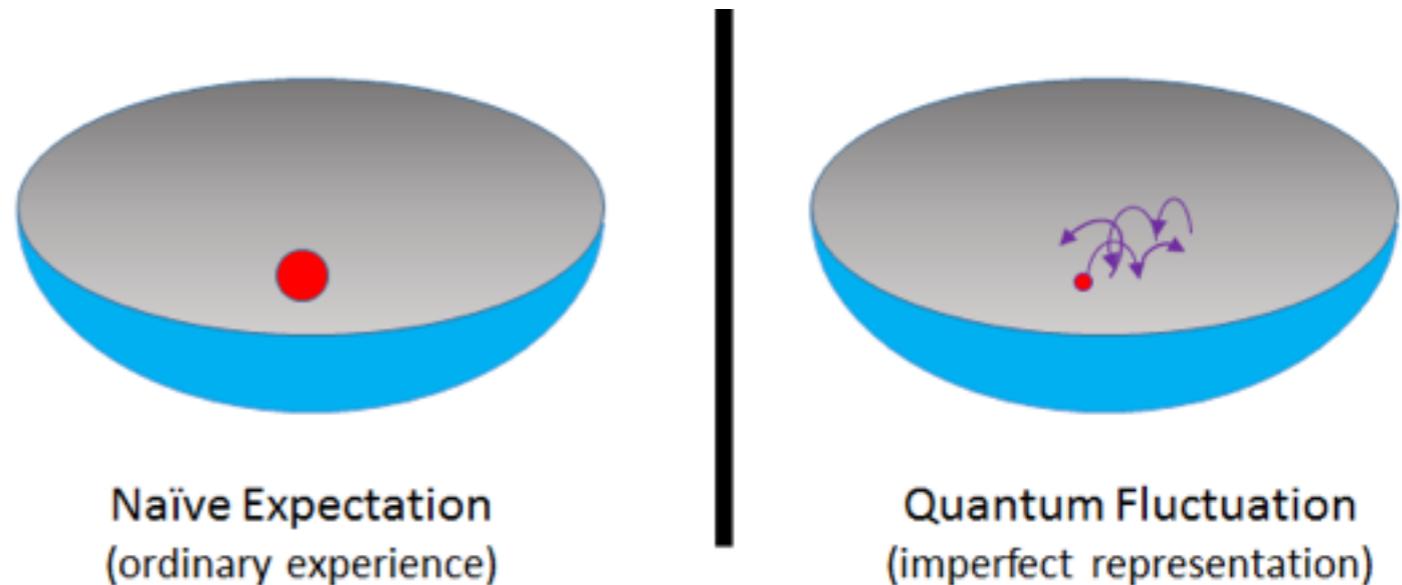

$$a(t) \sim a_0 \cos(m_a t)$$

cosmic expansion reduces amplitude a_0

Cold Dark Matter!

Quantum Production

Super-horizon modes of massive vectors redshift differently from scalars/tensors

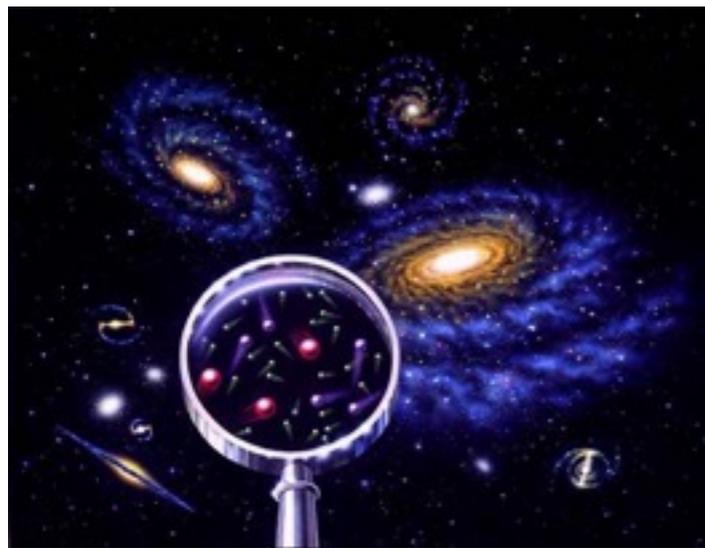

Right power spectrum at long wavelengths

**Guaranteed cosmic abundance. Natural Dark Matter Candidates.
Great potential to probe inflation!**

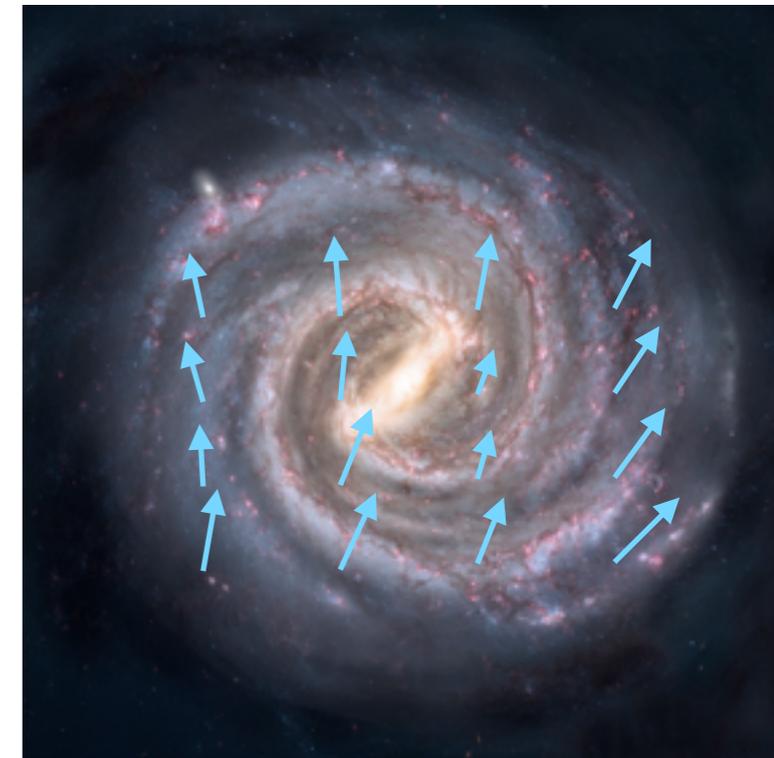

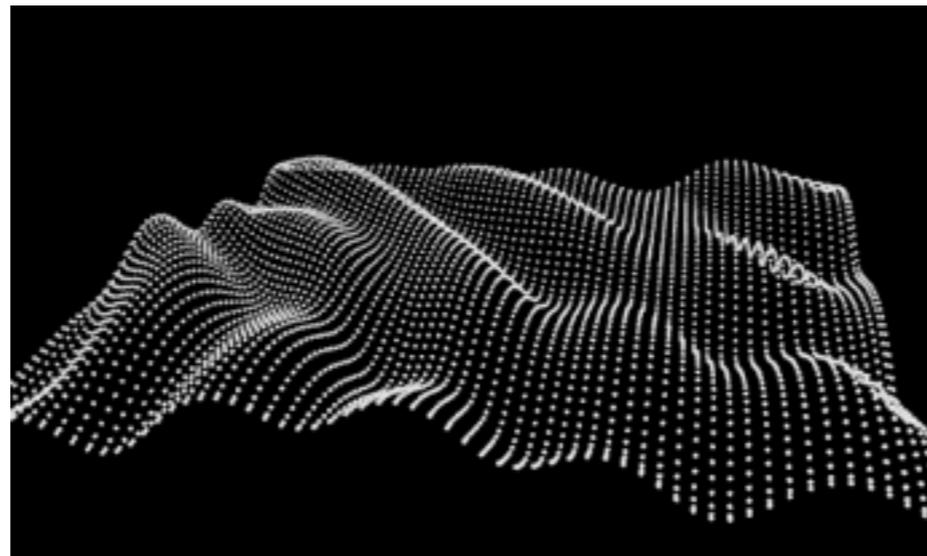

“Field” Dark Matter

What if ultra-light bosons are the dark matter?

particle DM

DM at long deBroglie wavelength
useful to picture as a “coherent” field:

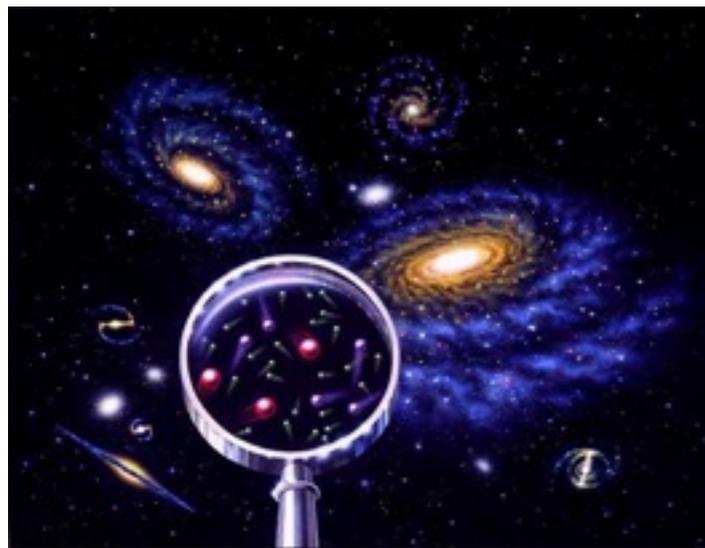

$$a(t) \sim a_0 \cos(m_a t)$$

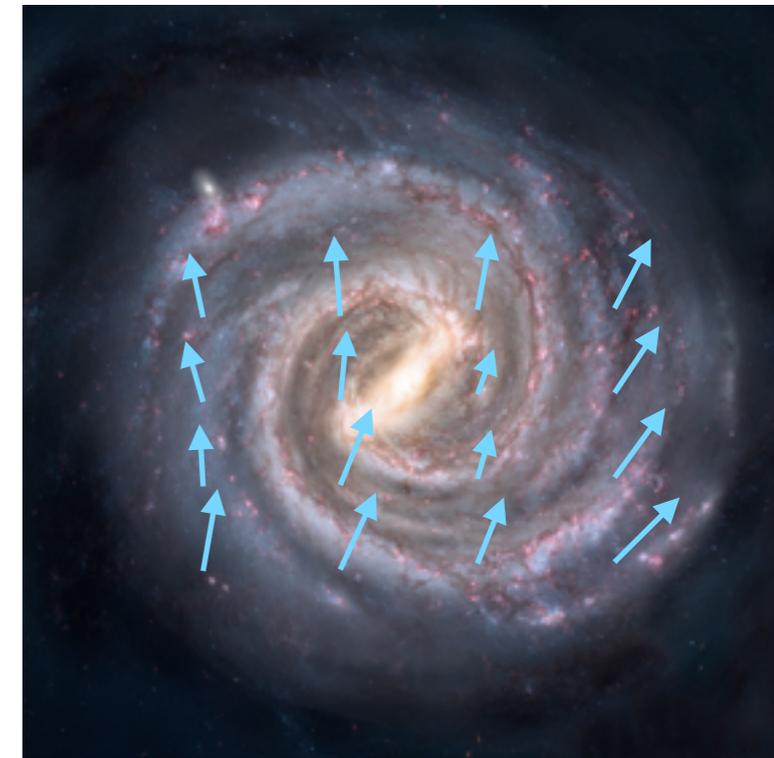

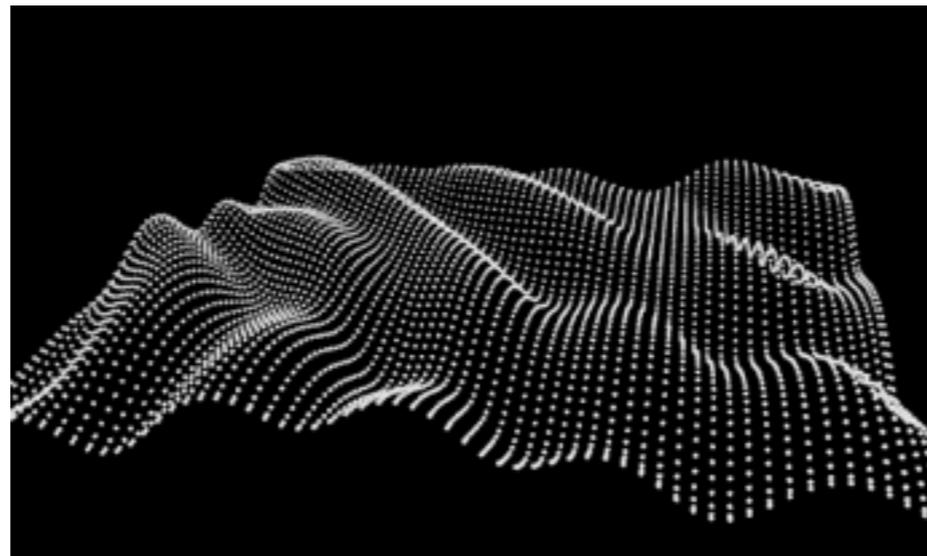

“Field” Dark Matter

What if ultra-light bosons are the dark matter?

particle DM

DM at long deBroglie wavelength
useful to picture as a “coherent” field:

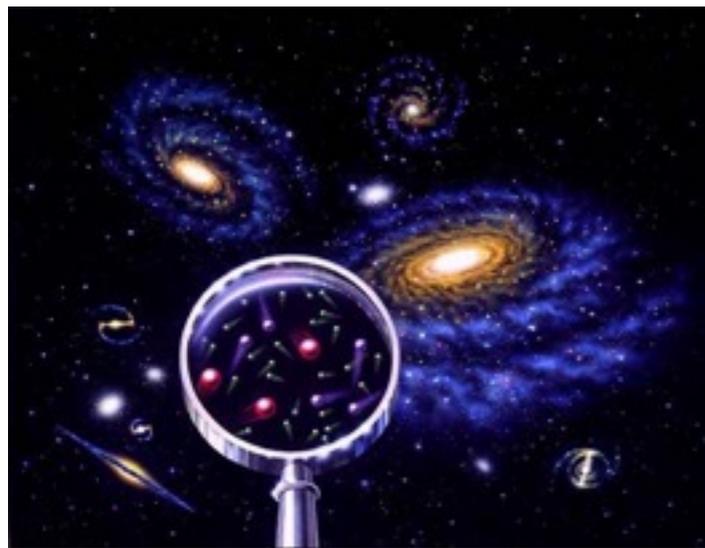

$$a(t) \sim a_0 \cos(m_a t)$$

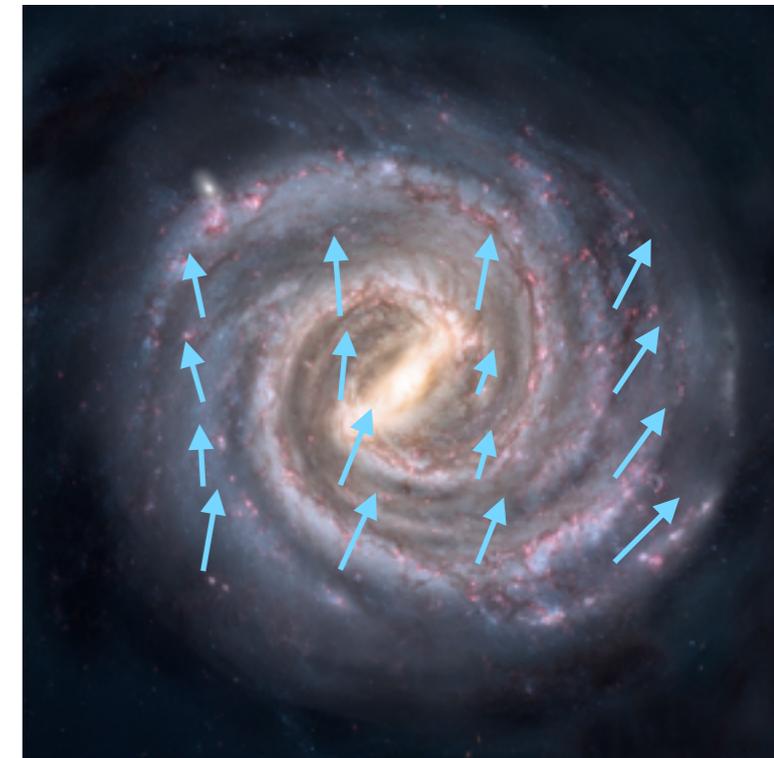

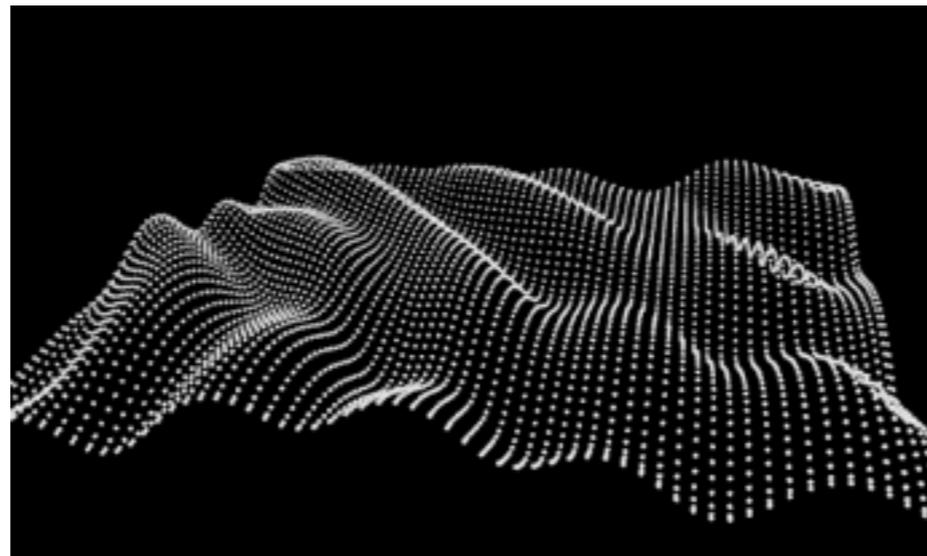

“Field” Dark Matter

What if ultra-light bosons are the dark matter?

particle DM

DM at long deBroglie wavelength
useful to picture as a “coherent” field:

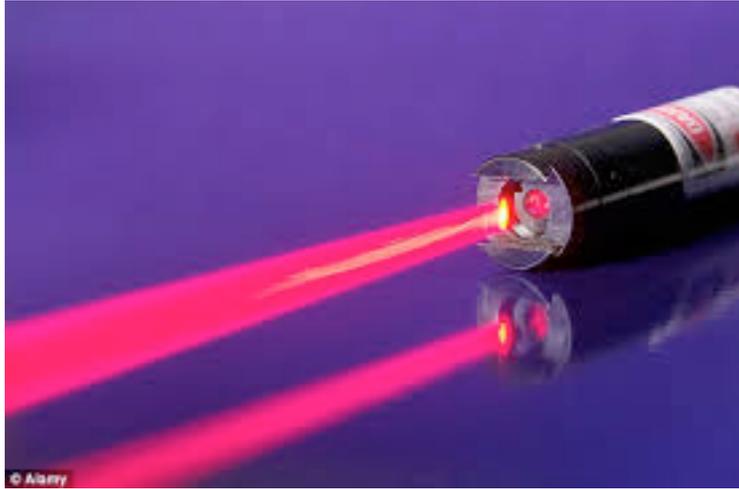

$$a(t) \sim a_0 \cos(m_a t)$$

What does this kind of dark matter field do?

Bosonic Dark Matter

Photons

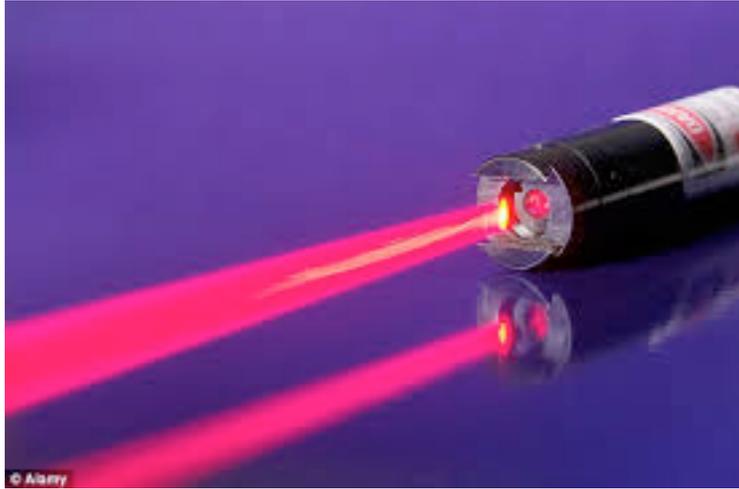

$$\vec{E} = E_0 \cos(\omega t - \omega x)$$

Detect Photon by
measuring time varying
field

Bosonic Dark Matter

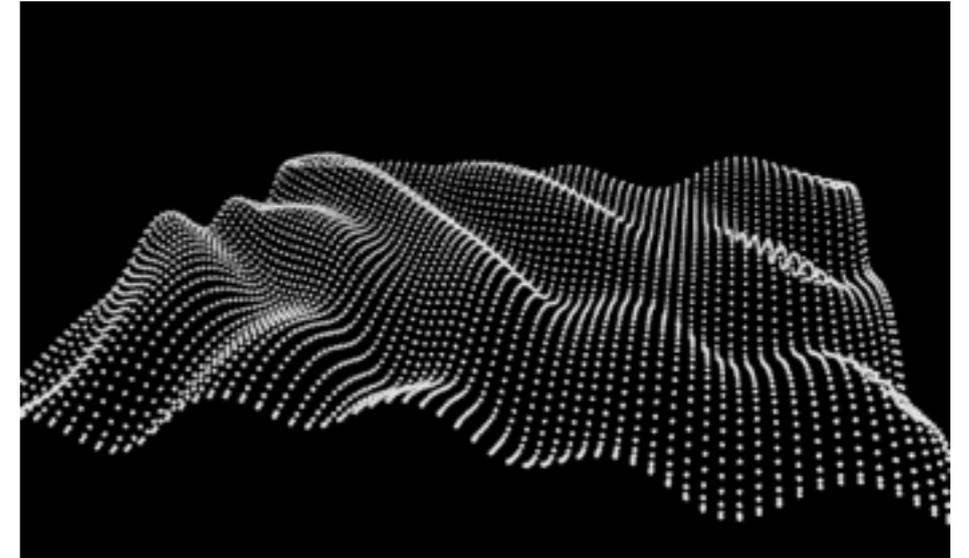

Photons

$$\vec{E} = E_0 \cos(\omega t - \omega x)$$

Detect Photon by
measuring time varying
field

Dark Bosons

$$a(t) \sim a_0 \cos(m_a t)$$

Spatially uniform in early universe.
Becomes stochastic during
structure formation

Correlation length
 $\sim 1/(m_a v)$

Coherence Time
 $\sim 1/(m_a v^2)$
 $\sim 1 \text{ s (MHz}/m_a)$

Bosonic Dark Matter

Photons

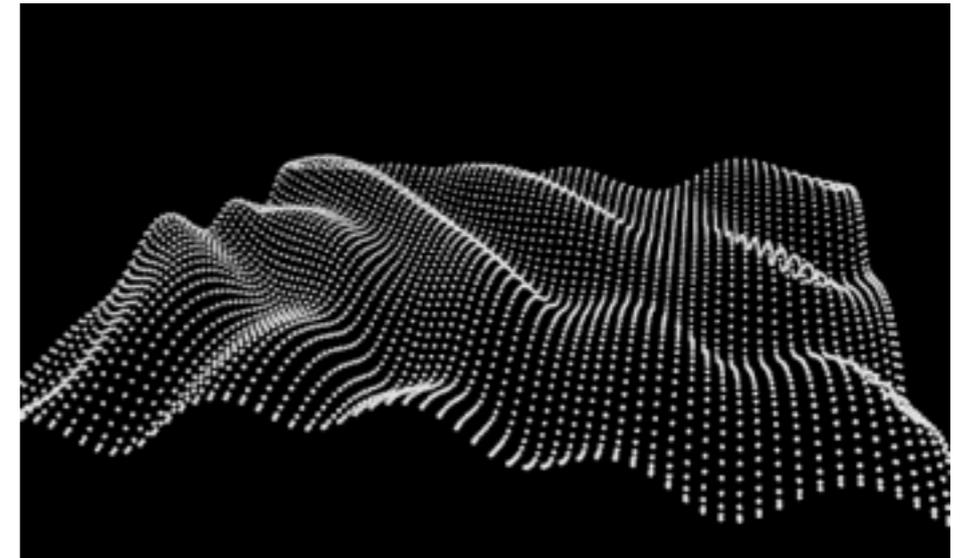

$$\vec{E} = E_0 \cos(\omega t - \omega x)$$

Detect Photon by
measuring time varying
field

Detect effects of oscillating dark matter field

Resonance possible. $Q \sim 10^6$ (set by $\nu \sim 10^{-3}$)

Dark Bosons

$$a(t) \sim a_0 \cos(m_a t)$$

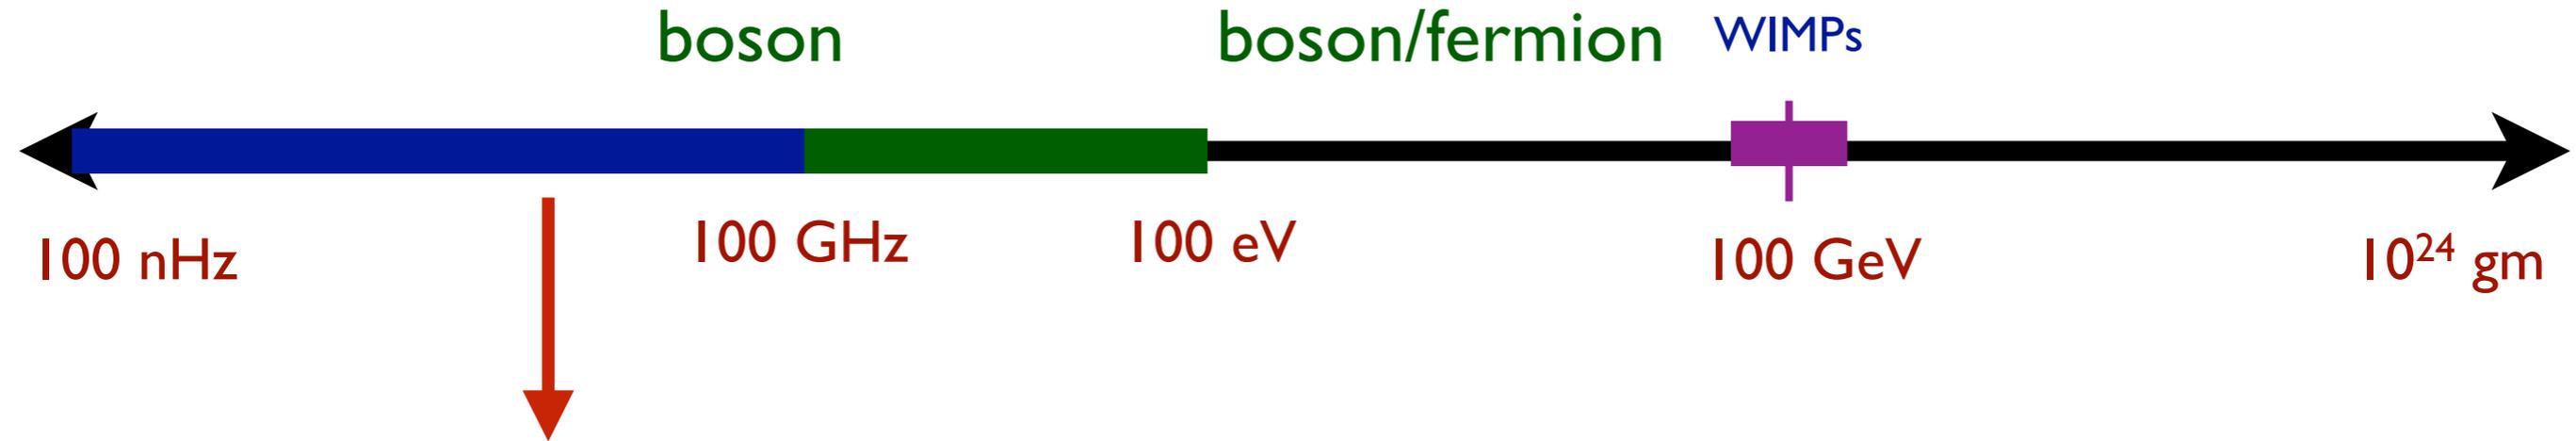

Spatially uniform in early universe.
Becomes stochastic during
structure formation

Correlation length
 $\sim 1/(m_a v)$

Coherence Time
 $\sim 1/(m_a v^2)$
 $\sim 1 \text{ s (MHz}/m_a)$

Experimental Opportunities

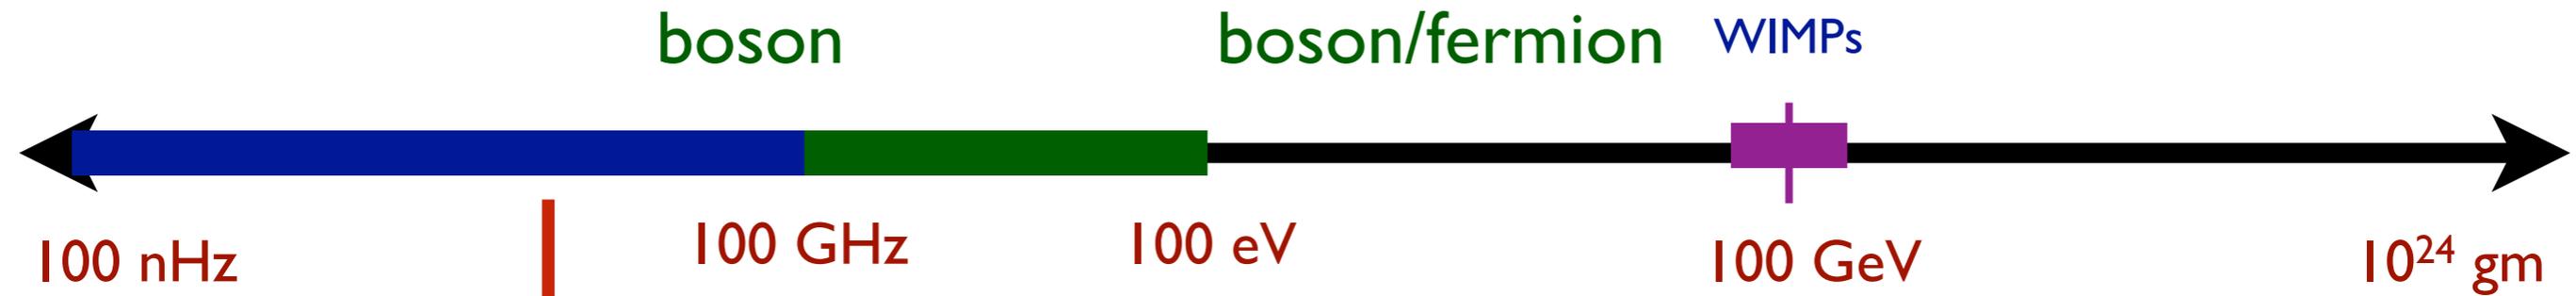

Ultra-light Dark Matter

Axions, Relaxions, Hidden
Photons etc.

Very low mass. Each particle
has very small energy

Ultra-light Dark Matter

Axions, Relaxions, Hidden Photons etc.

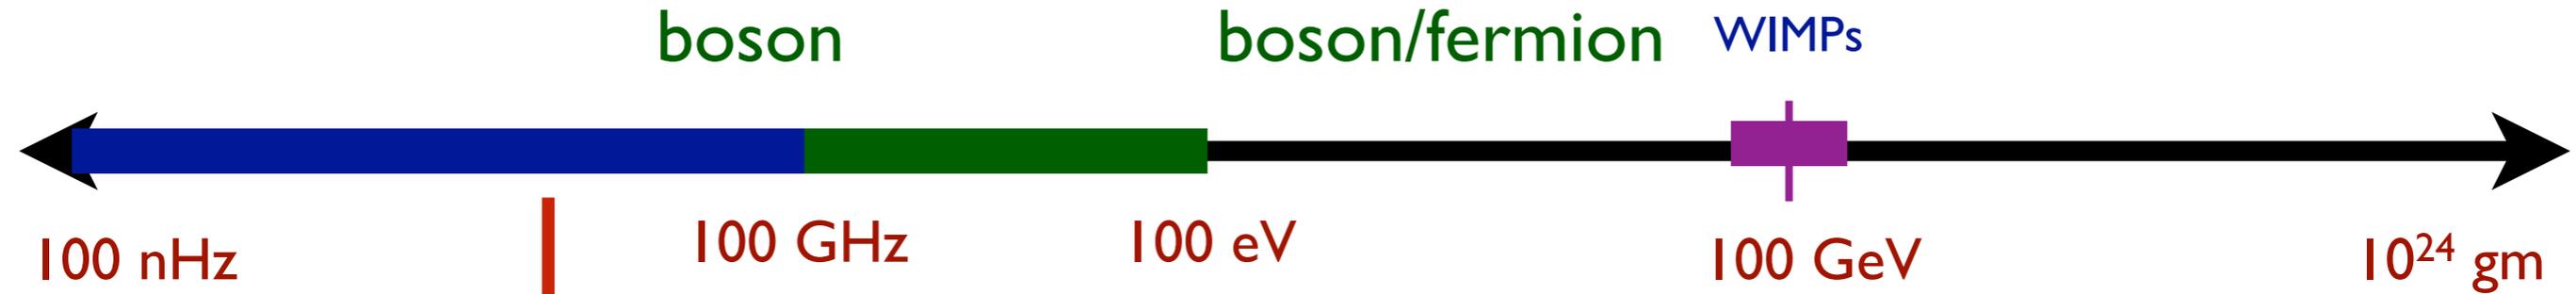

Very low mass. Each particle has very small energy

Large number density. Look for collective motion

Hard to observe wind molecules. Use collective windmill motion.
Dark Matter wind is a/c at dark matter mass. Easier to see.

Electromagnetic Resonators

Operator: $\frac{a}{f_a} F \tilde{F}$

Target: QCD Axion

Electromagnetic Resonators

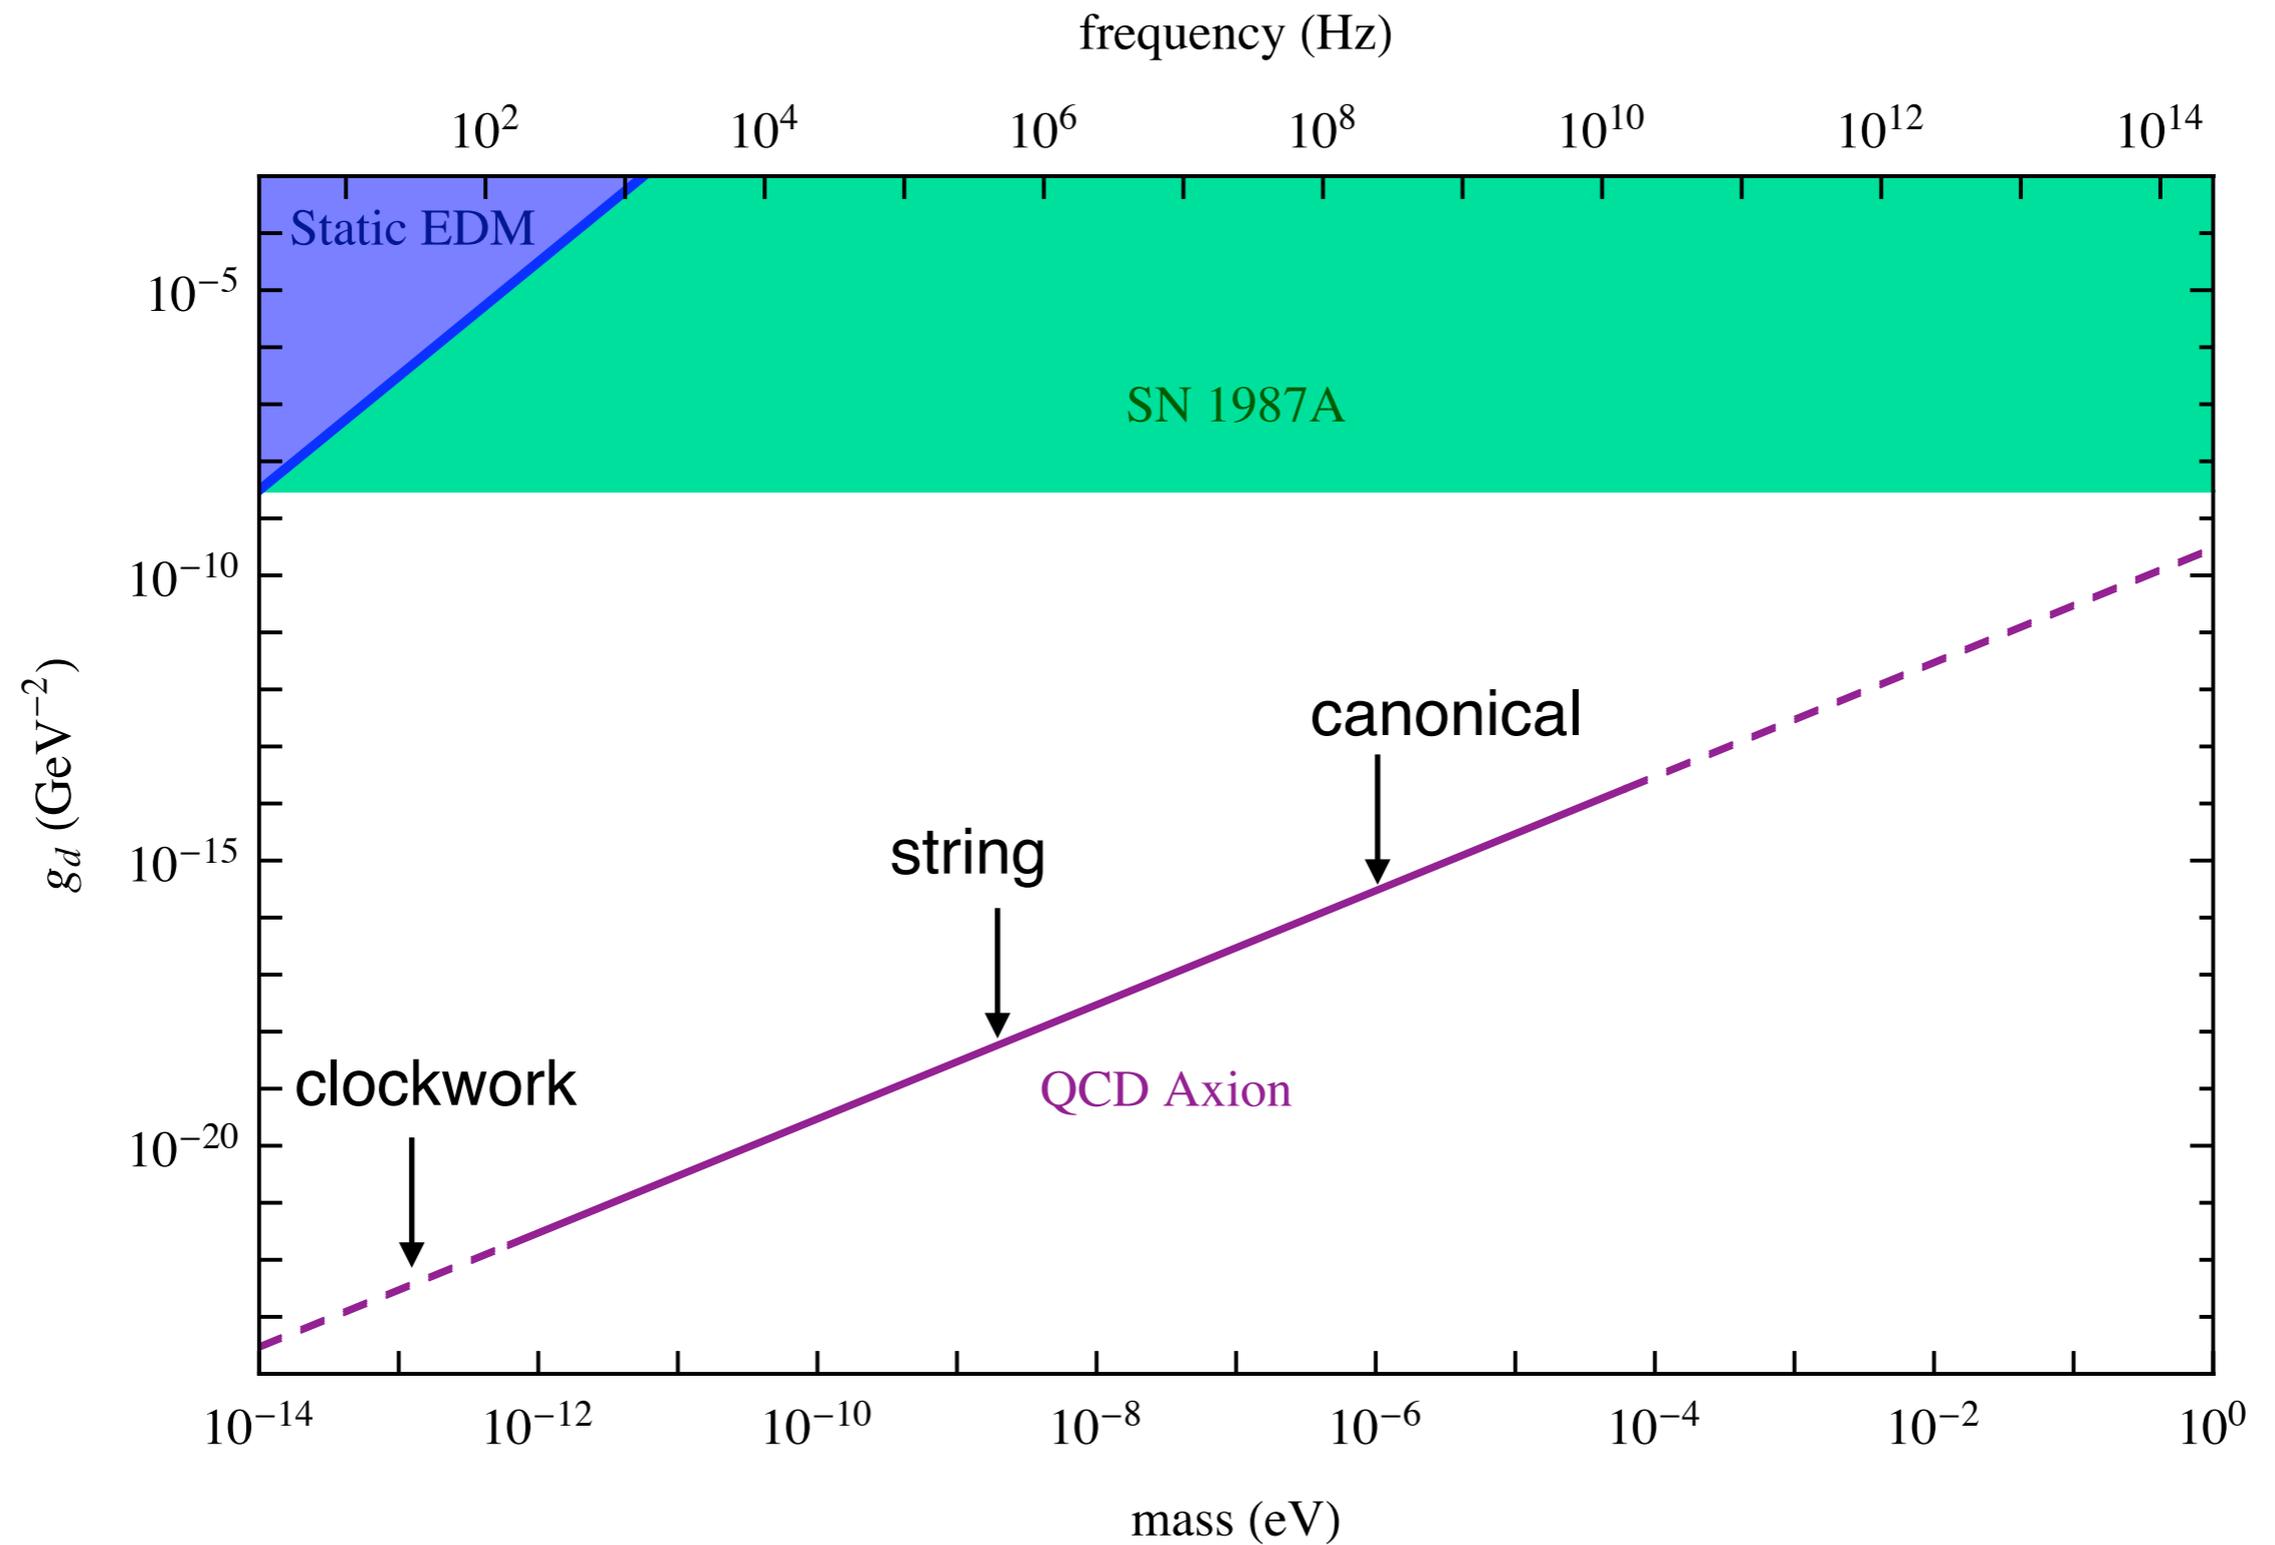

Operator: $\epsilon F F'$

$m_{\gamma'}$

Target: Hidden Photon

Probes Hubble scale at inflation

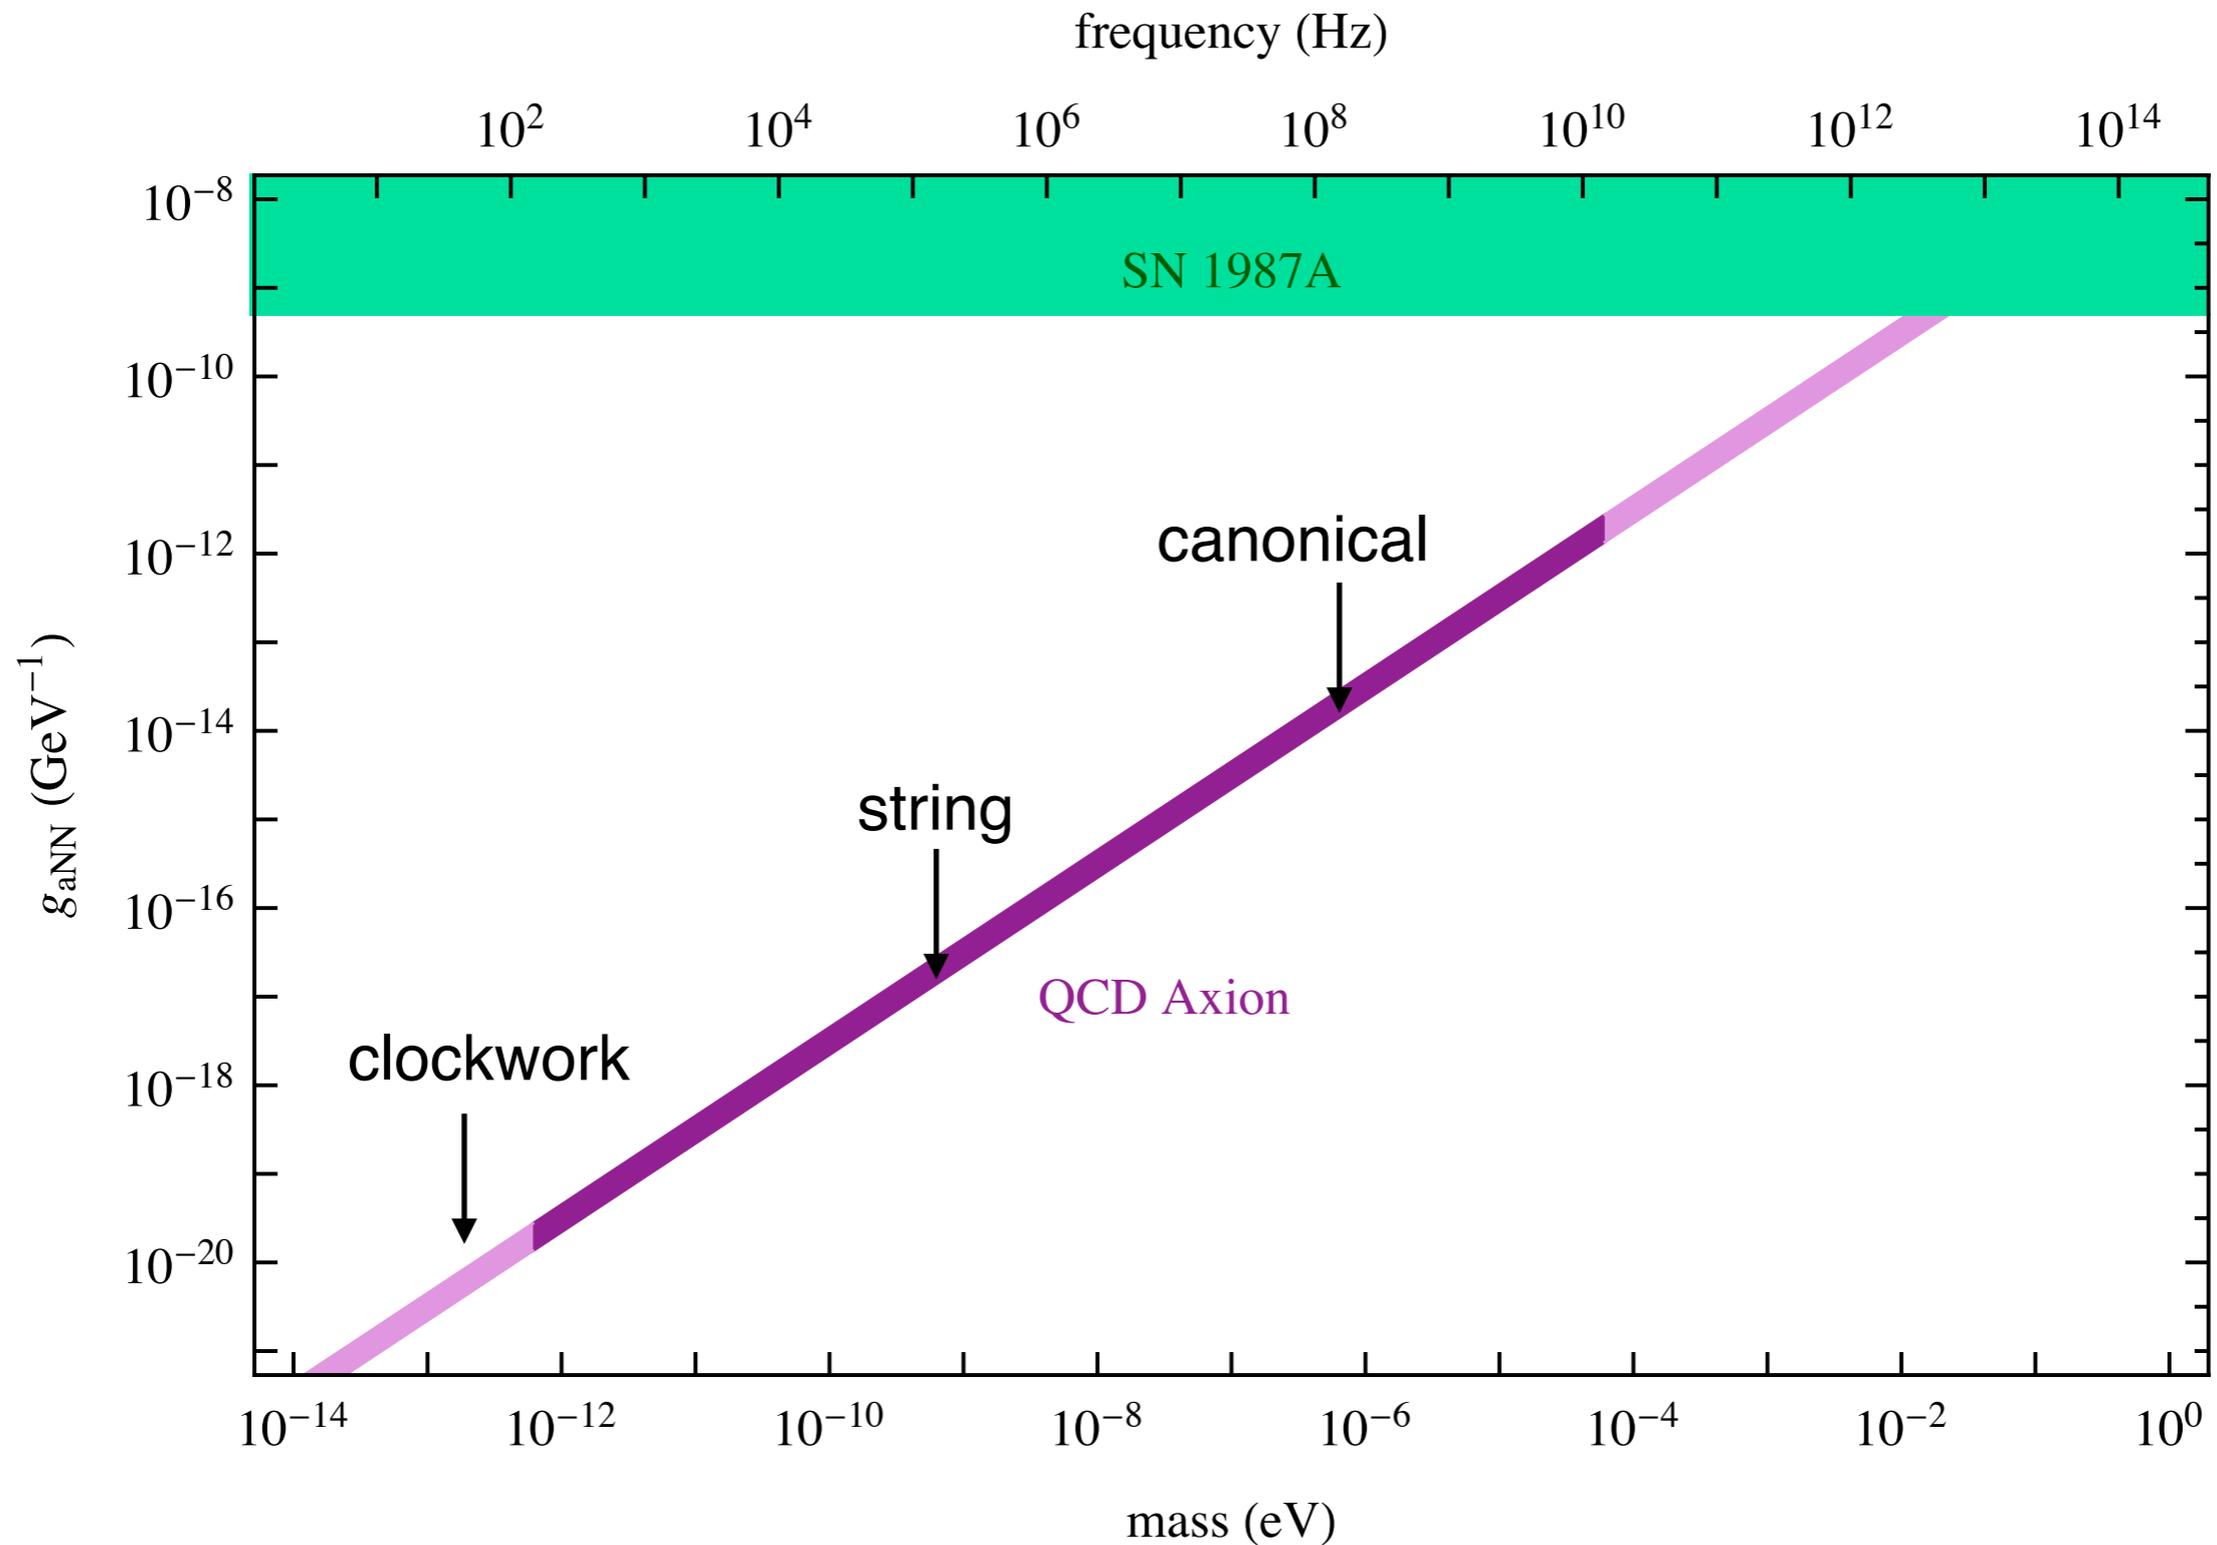

Spin Precession

Operator: $\frac{a}{f_a} G \tilde{G}$ (electric dipole moment)

Target: QCD Axion

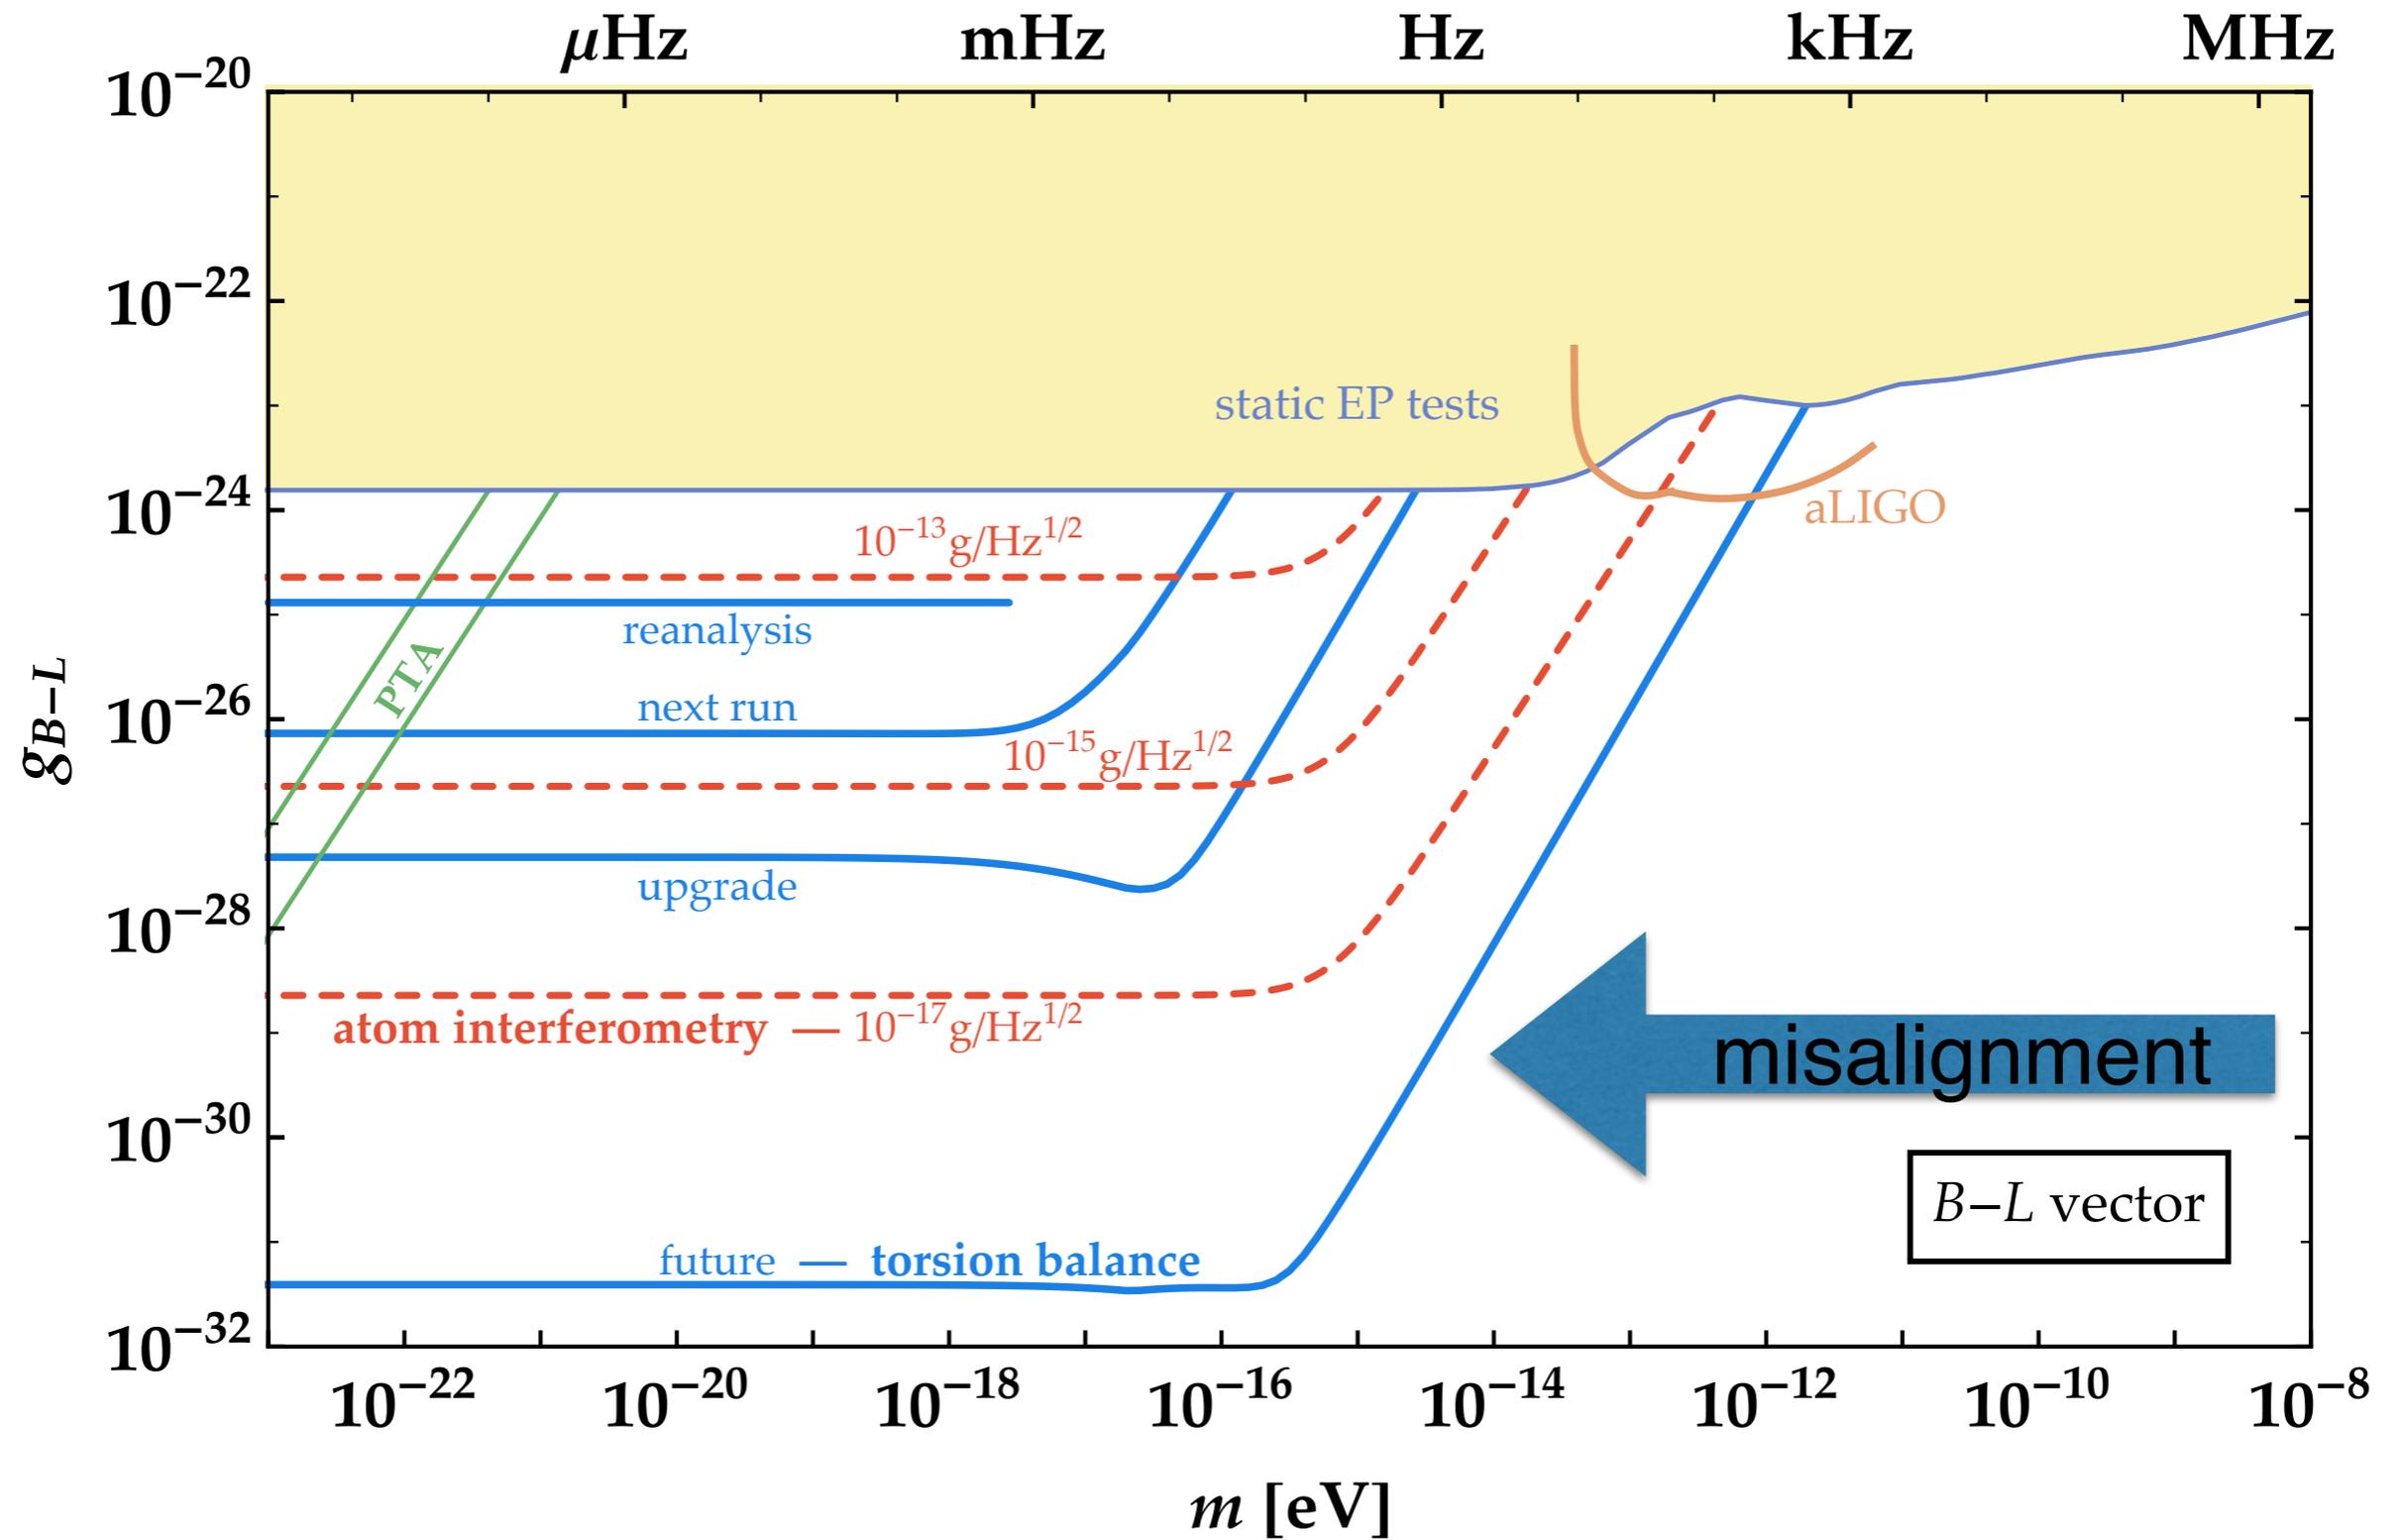

Spin Precession

Operator: $\frac{\partial_\mu a}{f_a} \bar{\Psi} \gamma^\mu \gamma_5 \Psi \supset \frac{m_a a}{f_a} \vec{v} \cdot \vec{S}$
 (axion wind)

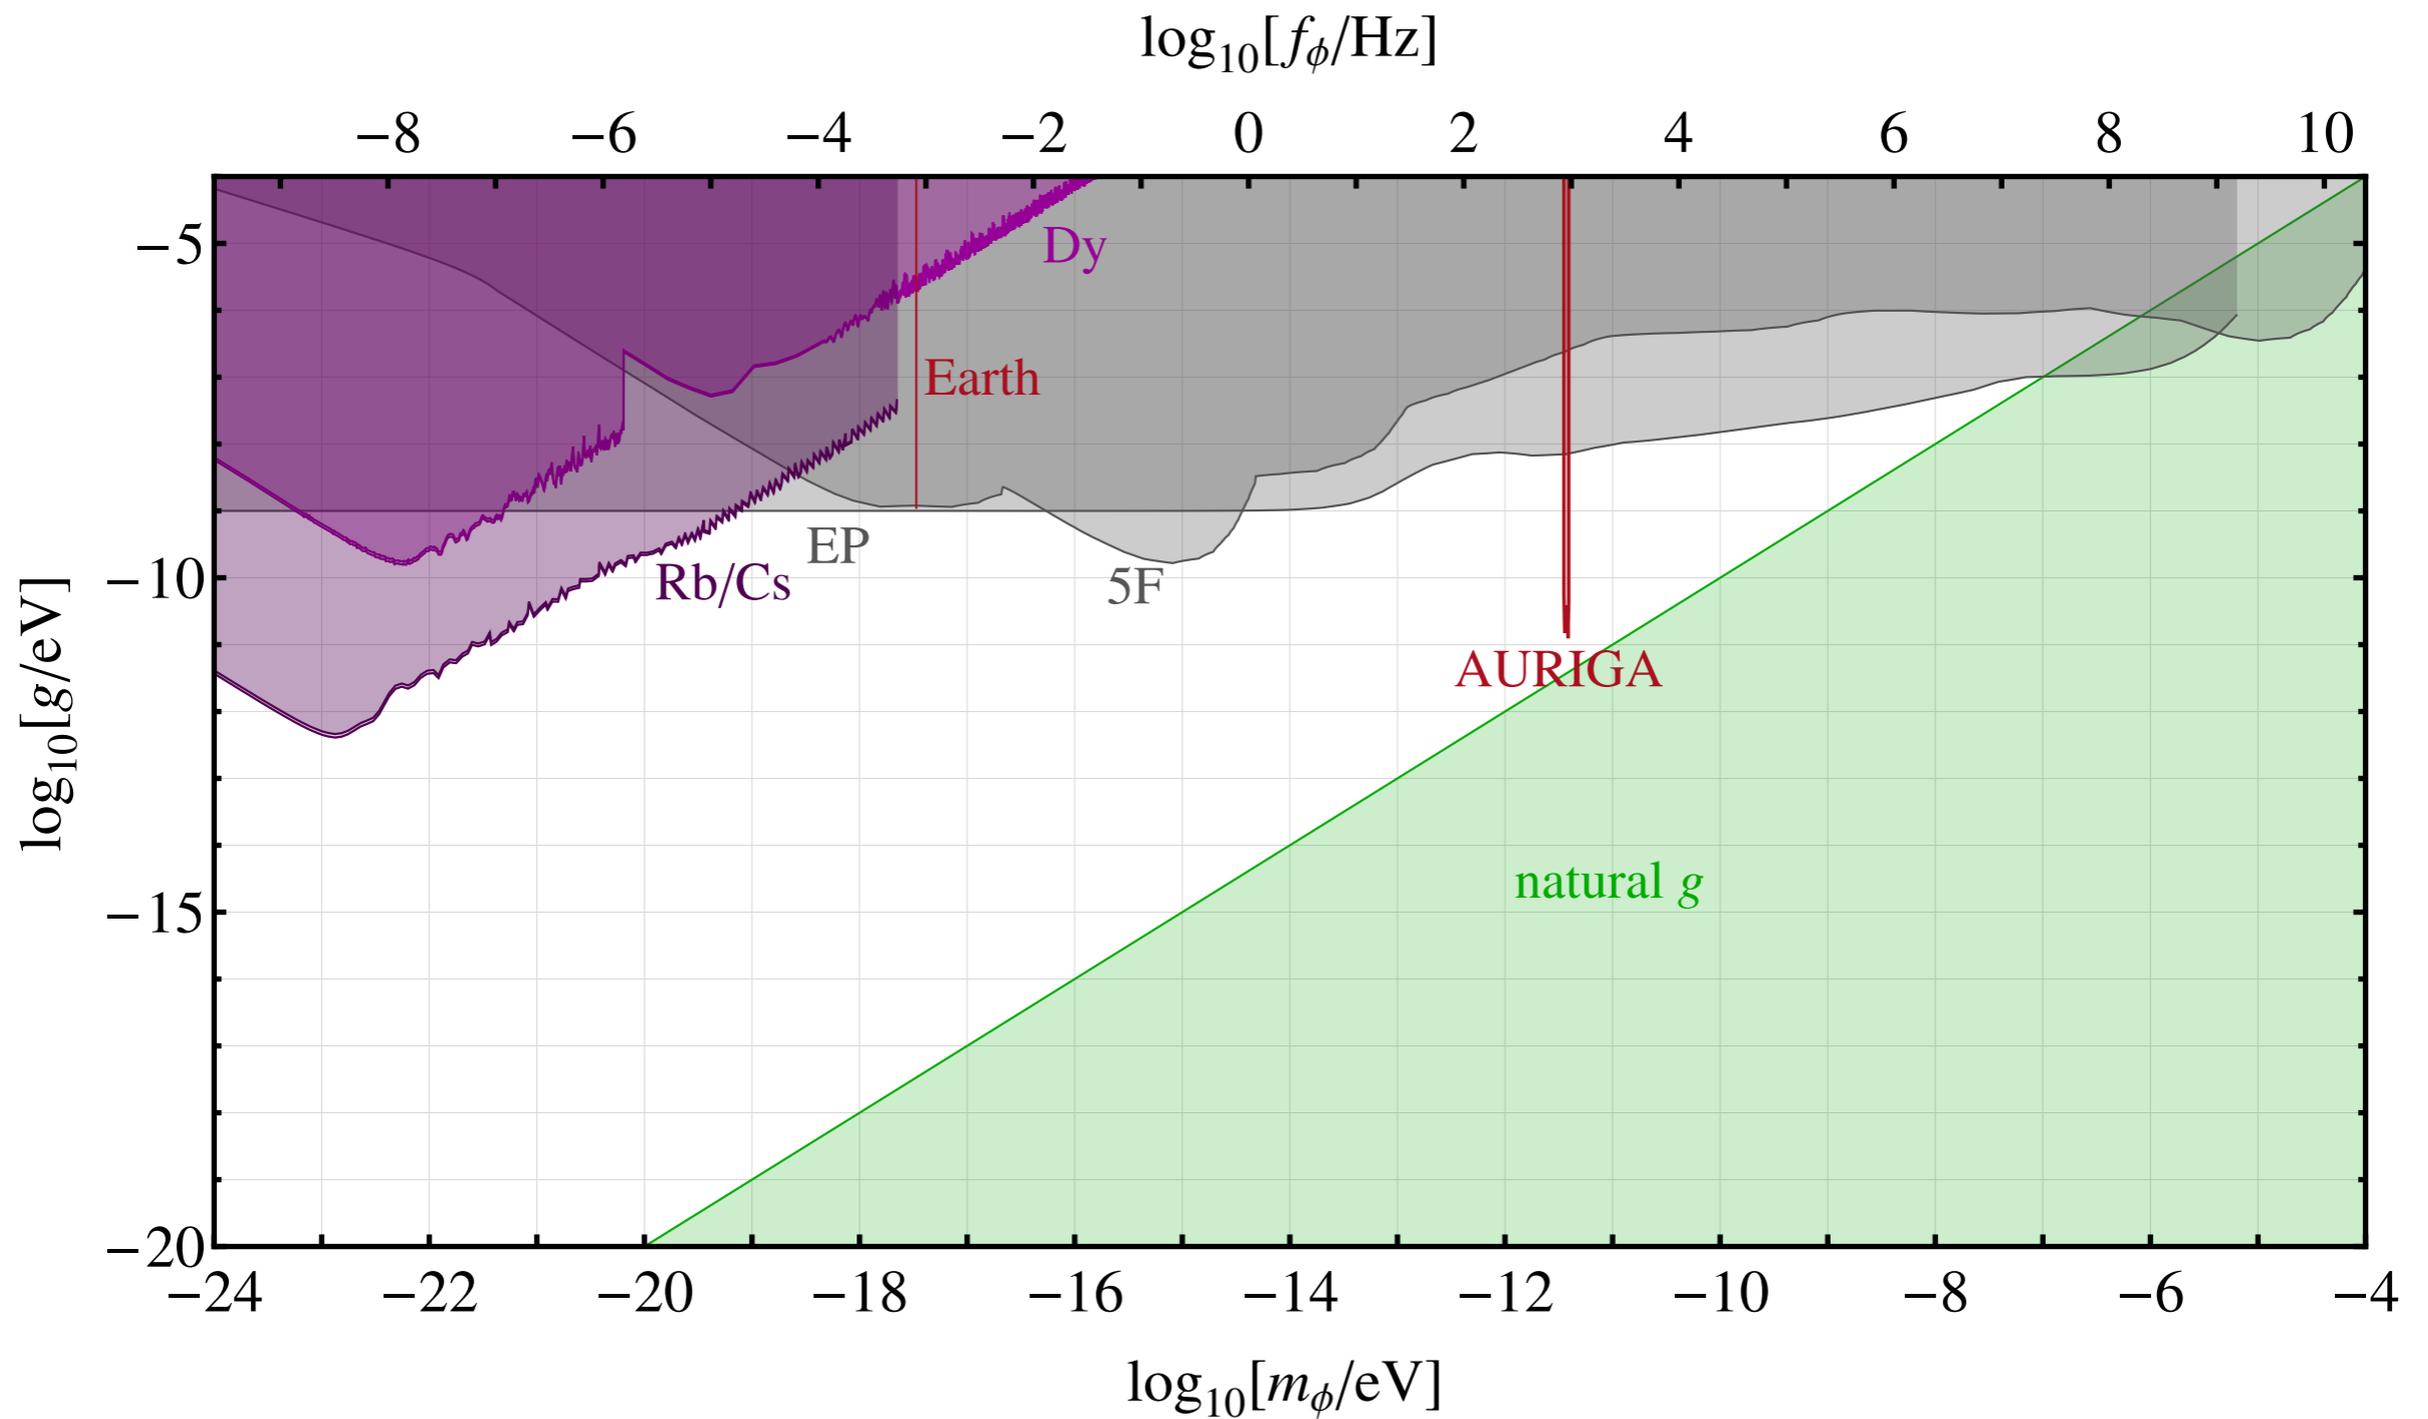

Target: QCD Axion

Accelerometers

Operator: $g A'_\mu J_{B-L}^\mu$

Fundamental Constants

Operator: $g\phi H^2$

Target: Relaxion
(natural g)

A complex dark matter sector. If there are strong self-interactions in the dark matter sector, the dark matter particles may collect into large lumps. Just like normal matter!

We have very weak constraints on dark matter self interactions

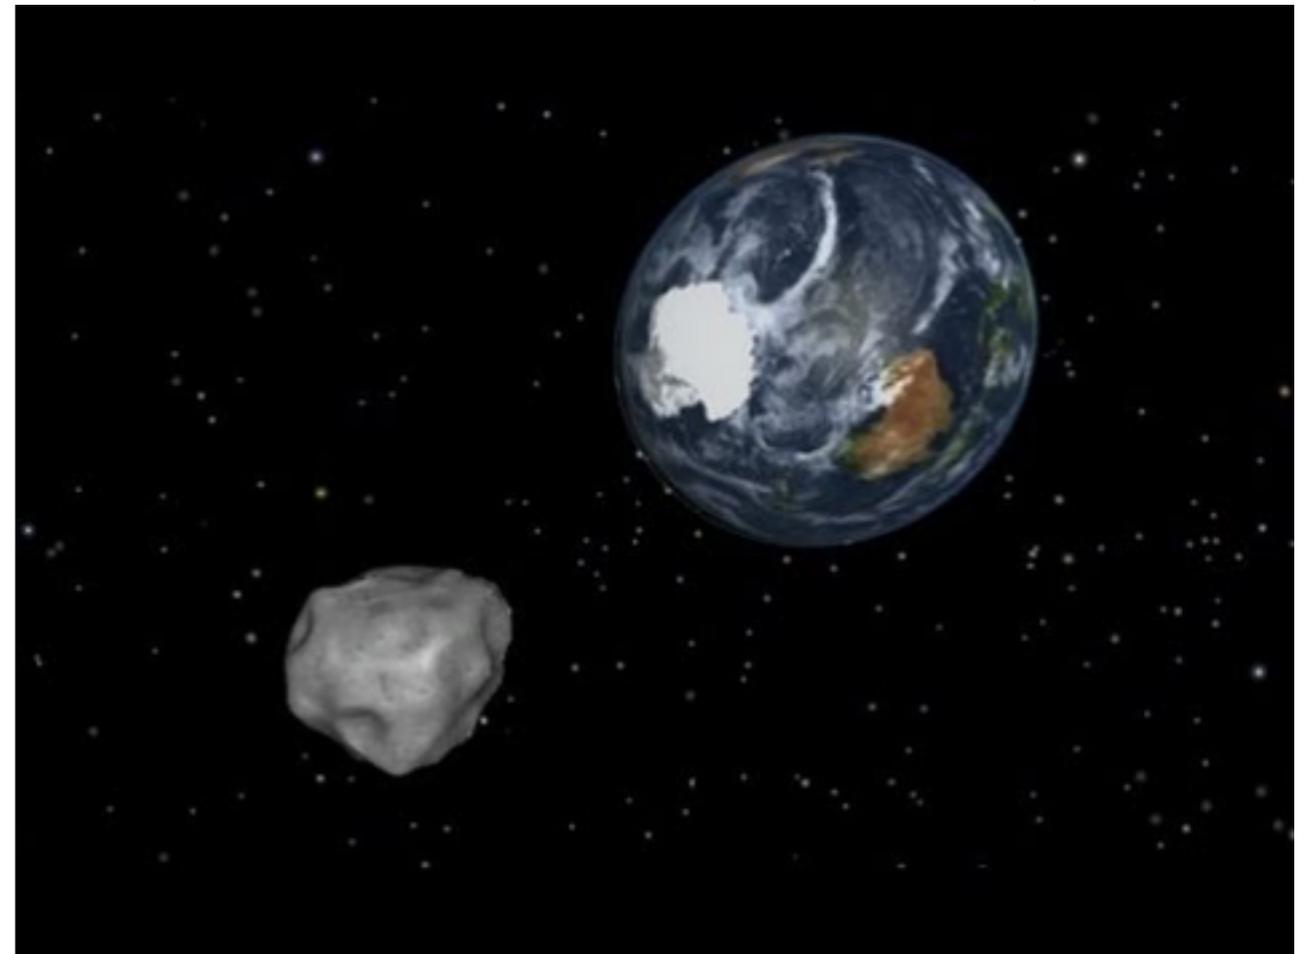

The Dark Matter Landscape

A complex dark matter sector. If there are strong self-interactions in the dark matter sector, the dark matter particles may collect into large lumps. Just like normal matter!

We have very weak constraints on dark matter self interactions

Low number density - need large, planet size detector

May source long range classical fields

Bonus: Ultra-Heavy Dark Matter

Rare Transit of Heavy
Dark Matter

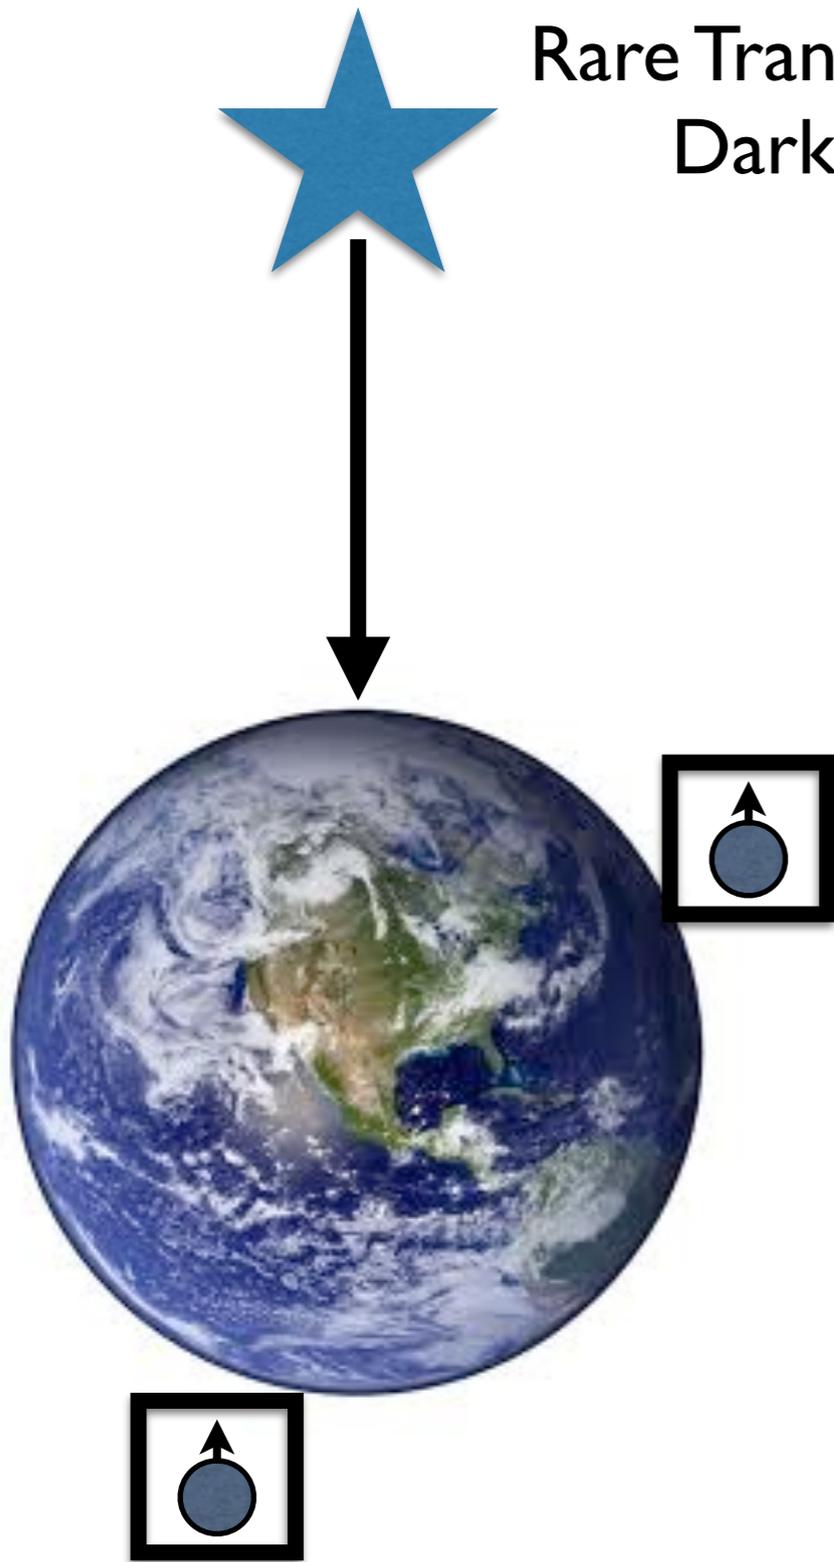

Bonus: Ultra-Heavy Dark Matter

Rare Transit of Heavy
Dark Matter

Classical field created by dark matter -
correlated excitation of multiple detectors

Same class of effects as light dark matter -
excitation of currents, spin precession, acceleration,
variation of fundamental constants

Bonus: Ultra-Heavy Dark Matter

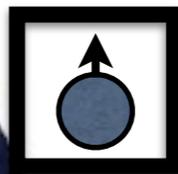

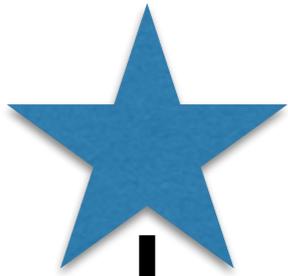

Rare Transit of Heavy
Dark Matter

Classical field created by dark matter -
correlated excitation of multiple detectors

Same class of effects as light dark matter -
excitation of currents, spin precession, acceleration,
variation of fundamental constants

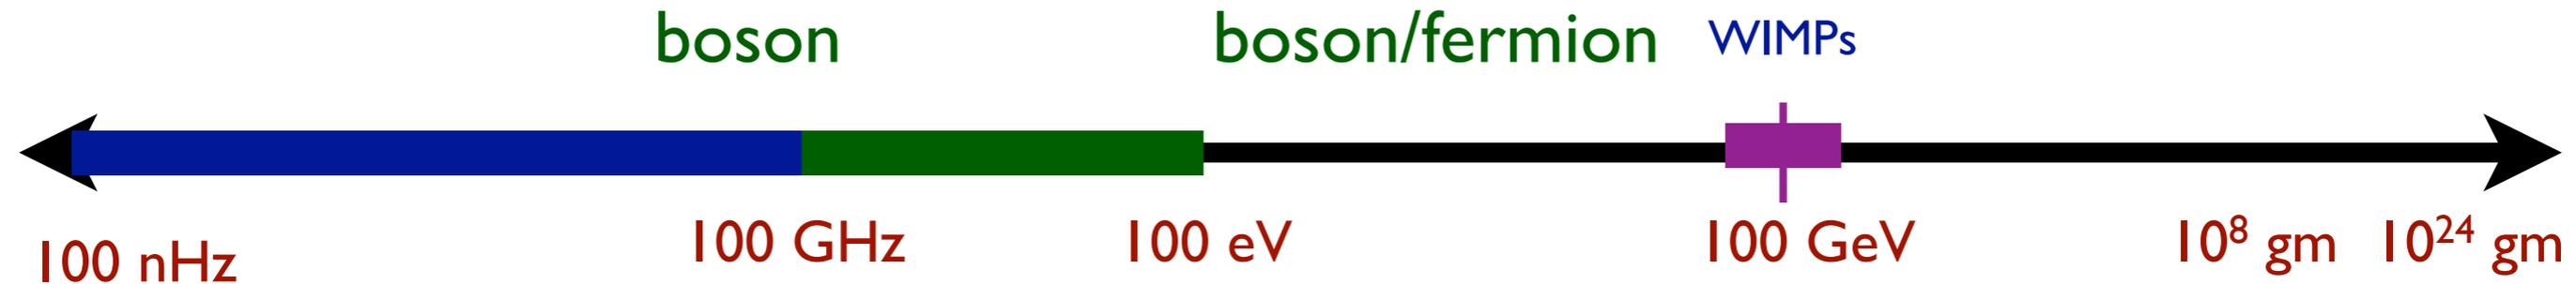

Instead of continuous, coherent a/c effect, look for
correlated transients in network

Up to dark matter mass $\sim 10^8$ gm
